

ABSTRACT

[00071] The present invention is directed to a light housing installed in close proximity to a light source. The light housing has a shield and a means for securing the shield. The means for securing the shield allows the shield to be removably attached in close proximity to the light source. The housing also has an aperture allowing the housing to be installed over and/or around the light source. The housing blocks light emanating from a light source, such as an in-ground staked floodlight, and keeps the light from shining directly into the eyes of a person observing the light source from behind. The housing also hides the components of the light source when in or near a natural setting.
